PAPER THAT KEEPS SECRETS FROM PHOTOCOPIERS

newsletter publishers and government censors have shared a common obsession: thwarting illicit photocopying of their pricey or secret information. Using blue paper was the first solution, and many other ink and paper colors have been tried—only to fall prey to newer copiers.

Now, Japan's Kiso Chemical Corp. believes

it has found a lasting answer: a "secrets paper," dubbed KSP, that is protected by a very thin film of evaporated aluminum. The metal coating deflects and scatters a copier's light so that the machine can't distinguish between type and background. Feed the bronze-color sheets into a photocopier, and out will come all-black copies. The main drawback is cost: KSP's introductory price is about \$1 per sheet, far more than regular paper, though that will drop with volume production. Still, the Osaka-based company expects to sell \$2 million worth of KSP the first year and sees demand tripling by 1995.
